RESOLUTION

ON THE

REPORT ON SETTLEMENT OPERATIONS

IN

THE AKYAB DISTRICT.

SEASON 1885-86.

Extract from the Proceedings of the Chief Commissioner, Burma, in the Revenue Department.—No. 11R., dated the 17th June 1887.

READ—

Report by Mr. H. Adamson, Settlement Officer, Akyab district, on the settlement work of the season 1885-86.

Review of the abovementioned report by the Commissioner of the Arakan Division.

RESOLUTION.—Mr. H. Adamson has submitted a very full report on the settlement operations which, during the season 1885-86, were carried out under his superintendence in the Akyab district. The area with which the report deals includes 41 circles in the Kyelet, Urittaung West, Rathedaung, Naaf, and Urittaung East townships. The report has been reviewed by the Commissioner of Arakan, and further recapitulation of the facts ascertained by the enquiry is unnecessary.

2. The correct measurements of the survey show that the area under rice cultivation is about 22 per cent. in excess of the area returned in the thugyis' assessment-rolls.

3. Although in a sense the people may be said to be fairly well off on the whole, and there is nothing to indicate that their condition is one of decreasing comfort, still their standard of living compares unfavourably with that of the population of the districts in the Irrawaddy delta. Their land is poorer and the grain which they raise is inferior.

4. The Settlement Officer points out that the present land revenue in Akyab is on the whole heavier than in the two Irrawaddy districts of Tharrawaddy and Prome, the former of which is, in point of fertility and communications, superior, and the latter quite equal to Akyab. In this fact the Settlement Officer sees a good and sufficient reason for not proposing any general enhancement of rates in Akyab. The Chief Commissioner concurs in this view. The existing land revenue seems as much as the people can at present afford to pay. Indeed the present rates are in some localities often paid with difficulty, and the revenue is not always paid without coercion.

5. The chief cause, however, of the heavy pressure of the present rates is the indiscriminate assessment, at a single rate, of all the lands, good, bad, and indifferent in a kwin. These single rates, though lower perhaps than good lands under favourable conditions can afford to pay, are unduly high for inferior lands. The unequal pressure of rates caused by this indiscriminate method of assessment was, as Mr. Adamson points out, aggravated by the summary enhancement up to 25 per cent. made for special financial reasons in 1879. This inequity of

incidence has been remedied in the proposed settlement, and rates have been assessed on the land after a careful classification of soil and tracts.

6. The evils arising from the inequity of incidence have been greatly increased by the omission to introduce into the district the rule that land left fallow should pay only a nominal rate of two annas an acre. In Akyab it seems to have remained the custom that lands, both cultivated and fallow, should be assessed at full rates. It is manifest that the indulgence of a low fallow rate is especially needed in the case of inferior lands, which more frequently require temporary rest and which are especially dependent for their yield on favourable conditions of climate. Thus out of the 12,938 acres of land, which have been shown by the Settlement Officer in the lowest class (Tract III, Class II), no less than 3,511 are described as fallow. The relief which will be afforded to the holders of land in this class by the settlement now proposed may be estimated from the following. That whereas the annual revenue previously levied was about Rs. 25,000, the new demand will be—

	Rs.
9,427 acres at Re. 1	9,427
3,511 acres at fallow rate of two annas	439
Total	<u>9,866</u>

7. The rates proposed for paddy-land vary from Rs. 2-8-0 to Re. 1, and as assessed should yield a revenue of Rs. 3,204, or '92 per cent. in excess of that previously derived (Rs. 3,50,165). The assessment appears to have been made with care and judgment, and is sanctioned accordingly. The proposed rates of Rs. 2 for garden and dhani cultivation, Re. 1 for miscellaneous cultivation, and As. 4 for solitary fruit-trees are also approved. The resulting total assessment at the new rates is Rs. 3,64,159-26 against Rs. 3,66,673-74. The decrease (Rs. 2,514-48) is, it is explained, apparent only, the survey having omitted to mark some garden and dhani cultivation.

8. The term of settlement will be 15 years. The new rates will be notified in the Gazette and will come into force from 1st July 1887. Now that the cultivators have been assessed fairly according to the quantity and quality of the land which they hold, and the rule for a nominal assessment (2 annas per acre) of fallow land is in force, the Chief Commissioner trusts that there will be no longer the same necessity for the use of coercive processes as in times past.

9. Mr. Adamson has proposed a scheme for the amalgamation of circles which should be worked up to and adopted as opportunity offers. The present arrangement is in several respects inconvenient; but it will be better to postpone any great changes until they can be effected without disturbance of existing rights, and until fully qualified thugis are forthcoming for the charge of the larger circles which it is intended to create.

10. The attention of the Commissioner is drawn to paragraph 16 of Mr. Adamson's report and a commencement should be made of constructing good bridges in the manner advocated and on a regular system, and the Deputy Commissioner should be ordered to visit every part of his district.

11. The grazing-grounds which have been proposed should be demarcated without delay and reserved under the rules.

12. The rule (No. 88) for assessment of fallow lands at 2 annas per acre came in force in April 1886. The Commissioner should see that this rule is strictly carried out in Akyab and in the other districts of his division.

13. The Chief Commissioner notices (paragraph 28 of Report) that the Settlement Officer was in doubt about his powers to enter on the areas of waste-land grants. The Boundary Act, V of 1880, and the Rules under that Act permit of the Boundary Officer entering on such areas for any of the purposes described in the Act; and all persons engaged in cultivation on such grants are bound to furnish the information required by Rule 32. The Government is very desirous of being kept informed of the condition of tenants and their holdings and rents in these grants.

By order of the Chief Commissioner,
D. M. SMEATON,
Offg. Chief Secretary.

REVENUE DEPARTMENT.

NOTIFICATION.

Dated Rangoon, the 17th June 1887.

No. 32.—Under the provisions of section 24 of the Burma Land and Revenue Act, 1876, and of Rule 37 of the Rules issued under that Act, the Chief Commissioner sanctions the following rates, which shall be for the term of 15 years the maximum rates of assessment within the kwins and circles of the Akyab district hereinafter mentioned, and such rates shall take effect from the 1st July 1887 :—

REVIEW
OF THE
REPORT ON THE SETTLEMENT OPERATIONS
IN
THE AKYAB DISTRICT.
SEASON 1885-86.

From Lieutenant-Colonel G. A. STROVER, Officiating Commissioner of the Arakan Division, to the Secretary to the Chief Commissioner, Burma,—No. 979-9—20, dated the 8th November 1886.

I HAVE the honour to submit the report on the settlement operations in the Akyab district for the season 1885-86 with nine appendices.

2. The tract in which settlement operations were carried on comprises the whole of the valley of the Mayu and the lower portion of the valley of Kalandan including four townships and 41 circles. The total area in acres brought under settlement is 424,786.76, or 663.71 square miles. Of this area, 161,344.56 acres are paddy-land, 16,046.83 acres fallow, 2,602.82 acres miscellaneous, and 3,603.33 acres garden or orchard-land. Of grazing-grounds 3,280.46 acres are culturable and 3,110.19 acres are unculturable. Land thrown out of cultivation is shown as 11,591.35 acres, village-sites 3,386.12 acres, monastery and pagoda land 507.49 acres, roads, canals, tanks, &c., 2,637.29 acres culturable land, tree, and jungle-bushes 23,671.34 acres, unculturable land of the same description 74,605.74 acres, grass-jungle culturable 39,260.79 acres and unculturable 19,789.98 acres, land under water 32,413.53 acres, and area of grants 26,984.97 acres.

3. The grants within the settlement comprising 26,984.97 acres consist of 9,501.25 acres paddy-land, 870.77 acres fallow, 289.01 acres garden, 332.74 acres miscellaneous, and 15,991.20 acres waste-land. The original area of the grant lands is given as 10,398.31 acres, or a little more than one-third of the area as decided by the Boundary Officer. Grantees and tenants appear to be mutually satisfied, but look with suspicion on enquiries made by Government officers, and are loath to give information. In two cases Mr. Adamson reports the holding-marking had to be postponed till next season as the tenants would not give correct information as to their boundaries and misled the holding-marker. It appears to me that, in the case of grants already settled, the Settlement Officer would only be justified in entering upon such grants for the purpose of holding-marking when the boundaries of the holdings adjoin or abut on Government land. The extension or otherwise of holdings within settled grants is immaterial, but when the boundaries of such holdings form a part of the external boundaries of such grant, it is essential that those boundaries be checked from time to time with the view to ascertaining that no unauthorized encroachments have been made on Government land, thereby enlarging the original area of the grant.

4. The statistical table on the subject of tenants within the settled tract shows that both rent and revenue are paid by tenants on 22,295.57 acres while revenue only is paid on 12,940.14 acres, and rent only paid on 4,886.74 acres. There appears to be little approaching to a permanent tenancy, the majority being tenants of under five years' occupancy.

5. The revision of rates of assessment has been twice carried out as far as records show, but in neither instance has the revision been quite satisfactory. The present settlement being based on an elaborate and detailed system, better

results may be expected. The increase of assessment since the year 1866 has been 66 per cent., and since the year 1882 the increase has been 3 per cent. The table of part assessment shows that the revenue on the settlement tract now is Rs. 3,66,673·74 as compared with Rs. 2,19,756·12 in the year 1866, or an increase of Rs. 1,46,917·62. The current rates of assessment vary from Rs. 2-8-0 to Rs. 0-8-0.

6. The low value of land in the settled tract is remarkable. The cause of this is not explained. The population has considerably increased of late years and with it the demand for land. Crops have been good and the market for the sale of grain fair. Rupees 9 per acre is a very low average. The table of sales of land for the past five years gives the number of such sales at 1,349, and the price paid Rs. 93,096. The land so sold probably consisted of inferior soil, or was owned by persons who were pressed by circumstances to part with their land at any price offered. Mortgages amounted to about half the number of sales. The average sum per acre on such is shown to be in advance of sales, although in many instances very low sums were received per acre on such mortgages.

7. Chapter IV of the report shows that the area under cultivation has increased by 51 per cent. within the past 20 years in the settled tract, being 152,519·38 acres as compared with 100,814·63 acres in the year 1866. This is a satisfactory increase. Statistics of population show that in 30 years the increase has been 73 per cent. This applies to the whole of the Akyab district, and therefore the increase in the settlement tract may be proportionately calculated.

8. Crop-cuttings were conducted over 198 acres, the average result giving an outturn of 77 baskets. Holding areas do not appear to have been affected consequent on increase in population. Detailed information regarding part holdings is said to be not available of a nature to admit of comparison with the present holdings. The revenue records of the past would, however, be a sort of guide in this respect.

9. The settlement tract has been divided into three separate portions for the purpose of settlement in accordance with the fecundity or otherwise of the soil, and other considerations as regards proximity of markets, &c. The assumed rates of productiveness taken as a basis for settlement purposes appear to have been calculated sufficiently correctly to admit of an equitable assessment, although, perhaps, little high on ordinary and inferior lands. Garden and miscellaneous collections are excluded from the calculation, as it has been found to be impossible to fix any rate of productiveness for this description of cultivation. The average price of paddy at Akyab for the past five years for the purpose of settlement has been taken in the subdivided tracts at Rs. 2, Rs. 9, Rs. 27, and Rs. 25, or very fair averages for the purpose applied.

10. The general consensus of opinion on the part of thugis is that the people have some difficulty in parts in paying the present demand. It may therefore be safely assumed that generally, for the present at any rate, the limit of assessment has been reached, for, as the Settlement Officer remarks, the tendency of thugis is almost invariably in the direction of enhanced rates on land if possible. The Settlement Officer in his own personal experience of other districts, Tharrawaddy and Prome, expresses his decided opinion that the present land revenue demand from the Akyab district is higher than either the present rates or the maximum sanctioned rates, or the highest rates proposed by the Settlement Officer in either of those districts. The conclusion arrived at is that no increase in the rates can be proposed and, for reasons given, no decrease is called for as a matter of urgent necessity. The chief cause of the heavy pressure of the present tax lies apparently in its incidence, and this the present settlement will, it is anticipated, remedy to a great extent. It is proposed to retain the present total revenue, such as it is, and to alter the distribution so as to make it press fairly on all. The settlement tract area therefore is divided into three tracts. In No. I tract it is proposed to fix an assessment rate of Rs. 2-8-0 on 1st class land and Rs. 1-8-0 on 2nd class land. In Tract II Rs. 2 and Rs. 1-4-0 and in Tract III Rs. 1-8-0 and Re. 1. This will result in an increase of 4 per cent. in Tract I, an increase of 8 per cent. in Tract II, and a decrease of 30 per cent. in

Tract III. For garden and dani cultivation a rate of Rs. 2 per acre is proposed, and for miscellaneous Re. 1. All these rates appear equitable and judicious under the circumstances mentioned by the Settlement Officer.

11. The resulting total assessment at the proposed rates is Rs. 3,64,214·34 as compared with Rs. 3,66,673·74 the expiring assessment, the difference being a decrease of Rs. 2,459·40 and which as explained is apparent only. In paddy revenue there is an increase of Rs. 3,259·17. The increase in the paddy area, owing to the correct measurement of the survey, is 22 per cent.

12. The report of Mr. Adamson is very full and complete. Chapter I contains much valuable and interesting information regarding the country, climate, history, ethnology, and agricultural condition of the people. The population of the settled tracts is (according to the census returns) 128,108, of which 28,532 are Bengalis. The occupation of the people is almost entirely agricultural. The method of cultivation is very similar to that in deltaic districts in other parts of the province. The different agricultural implements in use have been neatly illustrated by the Settlement Officer. Generally speaking the people are fairly well-to-do. There is no particular wealth among them and, as a rule, no extreme poverty. The statistics gathered regarding indebtedness show that 49·41 per cent. of the cultivators are free from debt, 38·04 per cent. owe money which they could pay off in a year, 11·37 per cent. owe more than they could pay off in a year, and 1·81 per cent. are hopelessly involved. It will thus be seen that the condition of the agricultural classes in this respect is by no means of an impoverishing nature. The purchase of cattle doubtless contributes very considerably towards indebtedness. Cattle-disease, if the statistics are correct, would appear to have diminished of late years as compared with the past. The total number of cattle in the settlement tract is given as about 88,000. In three townships visited by me during the year 1868 I found no less than 18,017 buffaloes and bullocks were recorded as having died in one year, and it was considered that the real number was far above this. There are 51 grazing-grounds in the settled tract containing an aggregate area of 6,390·65 acres and which are proposed for reservation. One acre for every 13 cattle is a very limited allowance. It may be possible to increase the area of grazing-grounds and, if so, such should be done as early as possible.

13. The state of communications appears to be very incomplete and unsatisfactory in the Akyab district. I can hardly understand however, notwithstanding imperfect communications, that circles within a few miles of Akyab have never been visited by District Officers. Rural Boards have apparently full scope for usefulness, and increased attention will be given to the state of communications.

14. In Appendix IX Mr. Adamson proposes a scheme for the amalgamation of circles situated within the settlement tract. This scheme appears to be well worthy of consideration and adoption as expediency occurs and opportunity offers. At present the circles are generally small and, it seems, are in some cases composed of several scattered pieces not contained within a single boundary. This is obviously inconvenient and undesirable on several grounds.

15. In conclusion I would solicit the sanction of the Chief Commissioner to the settlement now proposed. Mr. Adamson's report speaks for itself in every detail, and he appears to have conducted the settlement operations for the past season in a manner highly creditable.

G. A. STROVER, LIEUT.-COLONEL,
Offg. Commissioner of the Arakan Division.

REPORT
ON
THE SETTLEMENT OPERATIONS
IN
THE AKYAB DISTRICT.
SEASON 1885-86.

CHAPTER I.

GENERAL DESCRIPTION OF THE COUNTRY.

THE cultivated area of the Akyab district consists of the valleys of its four

NOTE.—Wherever the word 'basket' occurs in this Report it means not the Government standard basket, but the Akyab standard basket of one-half bushel capacity, i.e., one-half the Government standard basket.

-miles.

The general appearance of the country is a flat plain intersected by a network of tidal creeks. These creeks are fringed on both sides by mangrove jungle, which effectually intercept the view of the surrounding country from the traveller by boat or steamer. Within these narrow strips of jungle all is rice-fields.

The nature of the country is shown in the ordinary nomenclature of officials. The circle is a kyun (island) and the thugyi a Kyunôk (head of an island). The hills are covered with dense jungle, in which the most important trees are bamboo, sit, pyinma, kanyin, pyingado, and the wild jack tree, which is much used for boat-building. No teak is found.

These jungles are full of wild beasts of all kinds, which commit frequent depredations on the cattle in the plains; but, owing to the difficulty of travelling and the density of the undergrowth, Akyab has never been a favourite ground of the shikari.

2. The climate is agreeable, more so I think than most other parts of Burma. The cold season, November to February, might almost

Climate. The cold season, November to February, might almost be described as bracing. The hot season, March to May, can be tided over without much discomfort, owing to the deliciously cool sea breeze, which invariably appears early in the afternoon. The rains are at times rather trying, the total rainfall amounting to 180 inches. But, unfortunately, the whole of the district, both town and jungle, is a hotbed of malaria, and few Europeans or even Burmans can keep clear of that very aggravated form of jungle fever which is known by the name of Arakan fever.

3. The settlement tract consists of the whole of the Kyelet and Rathedaung townships, and part of the Urittaung East, Urittaung West, and Naaf townships.

The circles under settlement, with their areas, are as follows :—

Area brought under Settlement during the Season 1885-86.

These circles are generally small and often inconveniently divided, and in some cases a circle is composed of several scattered pieces not contained within a single boundary. I have accordingly made out a scheme for gradual amalgamation of circles, as vacancies occur in thugyships. This scheme will be found in Appendix IX.

4. The inhabitants of the tract are Arakanese and Bengalis. The Arakan-

(b) Races of the people. ese are divided into Arakanese proper (*i.e.*, original inhabitants of the lowlands of Arakan) and Chins, Chaunghas, Daignets, &c., tribes which originally lived in the hills by taungya cultivation and have gradually settled down permanently in the plains. There are also many settlers who have migrated from Ramree and founded villages in the Akyab district.

The Bengalis are Mahomedans from the neighbourhood of Chittagong, Ramoo, and Cox-bazaar. In the settlement tract they are found chiefly near the town of Akyab and in the north of the Mayu valley.

The Arakanese are of Burman stock and claim to be descended from the elder branch of the Mramma family. Though of an unmistakable Mongolian type, their appearance is somewhat like a blend between the Indian and the Burman, and in their habits, prejudices, and modes of thought they, in many particulars, more resemble Indians than Burmese. Their language is a dialect of Burmese and differs from it more in pronunciation than in idiom. Some idea of the difference may be gleaned from the following examples :—

English.	Burmese.	Arakanese.
Enter	Winthi	Won ri.
Go	Thwa	La.
Where are you going	Bégothwamile	Za la bo lè.
Two	Hnit	Hneik.
He does not eat	Masabu	Masa, or ma sa ba.
Water	Ye	Ri.
Horse	Myin	Mran.
Is	Shi	Hi.

5. The derivation of the word Arakan, or Rakaing, is doubtful. Phayre derives it from a Pali word meaning "the devil." A learned Arakanese gentleman has informed me that

it is derived from the words "ra" (to get) and "kaing" (to hold), a derivation which is more complimentary than Phayre's and expresses a characteristic of the Arakanese as compared with the Burmese, and is not a whit more far-fetched. They are called by outsiders "Mugs," a word derived by Phayre from Magada, the Buddhist Kingdom in India, and there is some evidence that a dynasty of this race once ruled Arakan.

The Arakanese "Ya Za Win" is a peculiarly uninteresting record. Early history consists of mere lists of kings. About 900 A.D. Shans from the Upper Irrawaddy invaded and held the country for some time. About 1000 A.D. it became tributary to the kings of Pagan. About 1250 it was independent and ruled by a warlike king, who received tribute from both Burma and Bengal. In 1570 the Arakanese conquered and annexed Chittagong. In the beginning of the 17th century the country was under the domination of Portuguese pirates, who had complete ascendancy over the king, but eventually he overthrew them and took possession of their stronghold, the island of Sundeep near Chittagong. In 1661 Shah Sooja, who had been defeated by his brother Aurungzebe, fled to Arakan, where he and his whole party were massacred. Up to 1784 the country seems to have been in a state of anarchy or civil war, king after king usurping the throne. In 1784 one party invited the Burmese to invade the country. This they did and conquered it without difficulty. The Burmese ruled with a rod of iron and their oppression is a byword among the people to the present day. The Burmese held the country till 1824, when on the advance of the British they left Arakan and retreated into Pegu. Arakan became a British province by the treaty of Yandaboo in 1826. There are scarcely any features of archaeological interest in the tract. The Urittaung pagoda may be mentioned. It is situated on a small hill on the bank of the Kaladan and was built by King Min Palaung about 1590 A.D. on his return from an expedition against the Chins and Mros.

6. The occupation of the people is almost entirely agricultural. In a few villages pot-making and basket-making are carried on.

(c) Occupations of the people. The fisheries are not worked by the people of the tract, nor is even the carrying trade in their hands. The cultivator conveys his paddy to the bank of the nearest creek and there his labour ends. The carrying trade is in the hands of boatmen from Akyab, Kyaukpyu, and Ramree, and of Natives of India, and the fisheries are worked by Madrassis and Chittagonians.

7. There is but little difference between the mode of cultivation in Akyab and that in deltaic districts in other parts of the province.

(d) Modes of agriculture. The land is ploughed with a plough proper, which turns the soil, and not merely scraped with a harrow as in Burma. Three ploughings are in ordinary soil sufficient, and then a light harrow is run over the ground.

INDIA OFFICE LIBRARY & RECORDS

The seed is steeped till it sprouts and sown broadcast. Except where the ploughings are too late for sowing, there is no transplanting. Reaping and threshing are done as in Burma. The grain is winnowed by dropping it from a height during the daily sea breeze.

8. The unit of land is the 'kyat' or dun, about 6.34 acres. "How much land do you own" would be expressed in Akyab "Le zane kyat hithile," "How many kyats do you own."

In Prome the same question would be "Le bene yank seik shithile," "How many transplanter's tasks does your land contain," and in Tharrawaddy "Le bene ya kin shithile," "How many hundred's outturn have you."

The kyat is divided as follows:—

3 Krants = 1 Cowri.
4 Cowris = 1 Gunda.
5 Gundas = 1 Kuni.
4 Kunis = 1 Kanni.
16 Kannis = 1 Dun or kyat.

9. Low-lying land is liable to inroads of salt water and cannot be cultivated without bunding. The bunds round the edge of Liability to floods. cultivation are rarely more than 3 feet in height

by 2 broad. Small creeks are also often bunded across and entirely closed. With these precautions there is little land in the tract actually damaged by salt water; and, on the other hand, land protected by bunds is generally rich and yields a heavy crop.

10. Notwithstanding the heavy rainfall high lands suffer from drought.

Drought. The soil is sandy and less retentive of water than that of the Irrawaddy valley. The water is soon sucked up and the green paddy left on a poor soil exposed to the hot sun quickly fades away.

11. From my own observation and the entire absence of complaint by cultivators I am inclined to think that the fields here Blight. suffer less from blight than they do in the Irrawaddy valley.

Though I have been frequently out in the kwins during the latter part of the rains, I have seen scarcely a field touched by it.

Many kwins suffer from the presence of a grass called the 'myet kalon,' which grows up in luxuriance and chokes the young plants.

12. Here as in other districts cattle-disease is the great enemy which the Cattle-disease. cultivator has to contend against. Drinking-water

is contained in tanks, and these, especially in the hot season, often present the most filthy appearance, and bad water must be a chief cause of the epidemics that are so common. No precaution is taken by the cultivator to prevent disease or the spread of disease. Segregating diseased cattle is done in the most slovenly and imperfect way; beasts are often seen lying dying in the fields, and when dead the body is left where it is to rot until vultures have devoured it, or thrown into the nearest stream. One can rarely go into the district in the rains without meeting bodies of dead cattle floating down the streams. The results of statistics taken in certain villages of the numbers of deaths and births of cattle during the year of settlement are as follows. The details will be found in Appendix VII:—

INDIA OFFICE LIBRARY & RECORDS						
1	2	3	4	5	6	7
1	1	1	1	1	1	2

Number of cultivators examined.	BULLOCKS.			BUFFALOES.		
	Number owned by cultivator at time of enquiry.	Died during 1885-86.	Born during 1885-86.	Number owned by cultivator at time of enquiry.	Died during 1885-86.	Born during 1885-86.
1,221	3,258	641	479	5,363	1,440	745

The average fecundity and mortality of bullocks for the year in the selected villages was thus 14 and 19 per cent., and of buffaloes 14 and 26 per cent. A glance in the appendix at such villages as Peindaw, Sabata, Thenatpaik, Myitna, Lamandaing, Rôkpundaung shows the effect of an epidemic, when it is not uncommon for three-fourths of the cattle of the village to be swept away in the course of a single month.

The disease most prevalent is rinderpest. Not a few cattle are carried away by tigers and leopards.

In some cases the cause of death was said to be starvation owing to the impossibility of obtaining grass. But though grazing is scanty enough, there must have been gross carelessness and laziness on the part of the cultivator whose cattle died from this cause.

13. As regards the quality of the cattle, buffaloes appear to be the same size and strength as those found in the Irrawaddy valley, Quality of cattle. but bullocks are as a rule small and stunted, and not by any means equal to those found on the other side of the province.

14. Fifty-one grazing-grounds, containing an area of 6,390.65 acres, have been proposed for reservation. The total number of cattle in the tract is about 88,000. This gives the

(e) Grazing-grounds. very scanty provision of one acre of grazing-land to every 13 cattle. Besides these the Mayu and Kaladan hills are used for grazing purposes, where the nature of their formation admits of it, and many cultivators also leave part of their holdings uncultivated in order to graze their cattle. With all this grazing is scanty. The people are very jealous of grazing rights. No one is allowed to graze cattle on his neighbour's land, and there are frequent quarrels on account of the inhabitants of one village making use of the grazing-grounds of another.

15. There are no fisheries in the tract except by way of license to use

(f) Fisheries. particular classes of nets, and these, as I have mentioned before, are worked not by the inhabitants, but by Madrassi and Chittagonian temporary visitors.

16. By water the communications are perfect. The whole tract is under the influence of the tide, and the country is intersected in all directions by tidal creeks. Consequently

(g) Communications. carriage to Akyab, the export market, is easy and the price of produce varies but little throughout the tract. Thus when paddy at Akyab was selling during the past season at Rs. 35 per hundred baskets, the rate (reduced to Akyab baskets) in the extreme north of the Mayu valley was not lower than Rs. 31. There are few villages that cannot be approached with ease by boats of two to three thousand baskets capacity.

Communication by land is a more difficult matter. Carts are unknown except in the immediate vicinity of Akyab, and there even they can be but little used owing to the innumerable ramifications of tidal creeks.

Roads from village to village are mere foot tracks without any bunding or formation. Small creeks are crossed by bridges of the rudest description, consisting generally of a couple of bamboos or a single log. To the European traveller, who cannot cling by his feet, these bridges present an appalling appearance. Use has made me callous, and I can now cross most of them without fear, but at the beginning of the season it was with anything but a steady pulse that I used to find myself, perhaps half-a-dozen times in a morning, oscillating on a bamboo 20 feet above a muddy creek with a probable crocodile waiting below to receive me.

Where the creeks are too broad for bridging there are in the most frequented routes public ferries, though not leased by Government, the stock in hand consisting of a small leaky dingy, the plier of which receives generally a yearly contribution of paddy or money from the villages concerned.

In consequence of the difficulty of travelling European officers rarely or never visit the interior of the district. Their tours consist of trips by boat or steamer, by which means of travelling, as I have already pointed out, nothing can be seen, and of halts in the villages few and far between, which are provided with rest-houses or comfortable zayats. Thugis living even within a few miles of Akyab informed me that their circles had never been visited by a European officer.

IOR 1885-86	V: (q) 21631	Reference V: (q) 21631	IOR 1885-86	Reference V: (q) 21631	IOR 1885-86	COPYRIGHT PHOTOGRAPH-NOT TO BE REPRODUCED PHOTOGRAPHICALLY WITHOUT PERMISSION OF THE INDIA OFFICE LIBRARY & RECORDS
-------------	--------------	------------------------	-------------	------------------------	-------------	---

The average amount of indebtedness was Rs. 90. In 60 per cent. of the cases the money was borrowed from Arakanese money-lenders and in 40 per cent. from Bengalis.

The rate of interest varies from 50 to 25 per cent. per annum. A common stipulation is 100 baskets of paddy per Rs. 100 to be paid at harvest time.

24. Those who own no land are chiefly agricultural labourers and coolies.

Non-agriculturists They live from hand-to-mouth and are by no means well-to-do. The traders found in the tract are chiefly money-lenders, but they are very few, and there is scarcely a village in the tract that can boast of owning a boat of 2,000 baskets capacity.

25. Generally speaking the people are in tolerably easy circumstances.

Condition and character of people. There is no wealth among them, but at the same time there is no extreme poverty, and their standard of living being a low one there is little pinching. As regards the character of the people, they are quiet and domestic, orderly and peaceful. Dacoity and robbery is almost unknown, and thefts and petty offences are less common than among the Burmese. They are much less given to drunkenness than the Burmese, and they are more loyal and better affected. They are, however, hot-tempered, and murders are common arising from quarrels about trifles. When roused to passion they show a reckless disregard for human life.

(d) Area of cultivation and waste. 26. The area of cultivation and waste is shown in the following table. The total area under settlement is subdivided as follows:—

CULTIVATED.		UNCULTIVATED.					
		Grassing-ground.			Tree and jungle bushes.		
161,844 acres.	Paddy-land.						
16,046.88 acres.	Fallow-land.						
2,602.82 acres.	Miscellaneous.						
8,608.80 acres.	Garden or orchard.						
8,260.46 acres.	Culturable.						
8,110.10 acres.	Unculturable.						
11,591.85 acres.	Land thrown out of cultivation.						
8,386.12 acres.	Village-site.						
607.49 acres.	Monastery pagoda land.						
2,887.29 acres.	Road, canal, tank, &c.						
28,671.94 acres.	Culturable.						
74,605.74 acres.	Unculturable.						
89,280.79 acres.	Culturable.						
19,759.98 acres.	Unculturable.						
32,418.53 acres.	Under water.						
26,084.97 acres.	Area of grants.						
424,786.76 acres.	Total area.						

It will be observed that 9 per cent. of the land is fallow and 7 per cent. has entirely passed out of cultivation and been thrown up. The reason is exhaustion of high lands and inroads of salt water on low lands.

(e) Average area of holding.

27. The average area of holding is—

	Acres.
Paddy ...	13
Garden ...	65
Miscellaneous ...	45

28. The following table contains all particulars about the waste-land grants

(f) Waste-land grants. found in the tract. Amongst other things it shows a comparison between their original and present areas. In most of them the cultivable land has nearly all been taken up. The

rent demanded from tenants, it will be seen, is not heavy, except in Bokdawmaw circle, which is part of the town of Akyab, and Thechaung, which is a cocoanut plantation. The grantees and their tenants appear to be on a friendly footing, and in most grants the tenants have fixity of tenure and can buy and sell occupancy rights. As these grants were reported on in detail by Mr. Mitchell recently, it seems unnecessary to add anything further in this report to the information furnished in the following table:—

sent they appear to be of the same class as the ordinary cultivators, and in fact many tenants are landholders who hire land in addition to what they themselves own.

The reasons for letting land are widowhood, sickness, death of cattle, &c., and the land is let from year to year, *i.e.*, the landlord has always the right to resume his lands after the crops have been reaped. In only 675 cases out of 4,106 has the tenancy lasted for over five years.

CHAPTER III.

PAST ASSESSMENTS AND FISCAL HISTORY

(a) Methods adopted at Past Assessments

30. There are records available of two revisions of rates. The first was Assessment of 1866-67 and was conducted by Messrs. Tracy and Hind, Assistant Commissioners. The outturn was tested by crop-cuttings, but areas operated on were too small to admit of reliable results. The following are the crop-cuttings on which the settlement was based :—

The outturn was found to be from 60 to 136 baskets. The size of basket is not stated, but I imagine it to have been the bushel-basket. The price of produce is stated to have been Rs. 35, i.e., I presume Rs. 17-8-0 per 100 Akyab baskets. Tables were prepared showing the cultivated area, the area of available waste, and the proposed rate. But little or no explanation is given of the reasons for fixing the rates. The result of the settlement of 1866-67 was that in most kwins the rates remained as before, in a few they were reduced, and in none increased. The reasons given for reducing rates are exhausted soil and a desire to encourage the cultivation of waste. A few lines of remarks are devoted to each circle, but as these remarks contain chiefly a rough description of the circle and its boundaries, and scarcely anything that would be useful now or applicable to the present settlement, I need not waste space in quoting them.

31. The 1879 assessment arose in a proposal of Colonel Sladen's to increase the rates by 25 per cent. all round on account of the Assessment of 1879. greatly enhanced price of produce. When Colonel Sladen wrote, paddy was selling in Akyab at Rs. 45 per 100 baskets.

The assessment was carried out by Mr. Hodgkinson, Commissioner of Arakan, with the assistance of Mr. Courneuve, Extra Assistant Commissioner.

Enquiries were made in each kwin, and tables prepared showing the increase or decrease per cent. of cultivation in each kwin since last revision, the outturn of best and average land in the kwin, the local prices of produce, the cost of cultivation, and the incidence of capitulation-tax. These tables formed the basis of assessment, and the result was that the rates were increased all round on an average of about four annas per acre.

This assessment was conducted with much pains and care, but I regret to say that it was by no means a successful one. In many cases, where the distribution of rates of 1866-67 had been inequitable, the evil was enhanced by the settlement of 1879, kwins already overtaxed were raised four or six annas, and in some circles the changes of rates appear to one who has not the table of statistics before him to be haphazard, and neither thugyi nor cultivators can explain them.

The reason appears to be that too much reliance was put on the table of statistics and no account was made of the opinion of thugyi and people of local experience. Mr. Hodgkinson wrote: "This matter (i.e., the revision of rates) I have kept pending until the detailed statistics for 1878-79 for each circle should be available. By this means I may have lost an opportunity of having the thugyi consulted when present at headquarters; but as regards Akyab district, I do not think this is much to be regretted, for the thugyi here really cannot be relied on in a matter of the kind."

32. The statistical tables and remarks prepared for the assessment of 1879 Record of 1879 assessment. are interesting and useful, and I think it is worth while reproducing them here. I have, however, made a summary, circle by circle, instead of giving them kwin by kwin as originally compiled.

											Average number of baskets owned per acre in best land per km².
											Number of baskets owned per acre in best land per km².
											Cost of cultivation.
											Incidence of cultivation-tax (After- outturn) on each cultivated area of circle.
											Remarks.
10	Wabo	... ***	Rs. 2-4	Rs. 2-136	Rs. 2-4—2-0	Rs. 2-226	Rs. 100	Rs. 55-0	47—45	Rs. 74-90	Rs. ...
											Rs. 0-6—3
											Rs. ...
											The decrease in Byat Hyah and Kadlinbyke is attributed to the influx of salt water, which the cultivators are too indolent to attempt bunding out. The good and bad lands are so mixed up that it would be impossible to divide them. Wabo Kwin can bear one rate, the land being uniform throughout. Communications perfect. Position exceptionally good, as godowns are situated in the southern part and this proximity to the market gives the cultivators the additional advantage of being able to keep themselves informed of the daily fluctuations of the market in Akyab. Cost of cultivation—Mr. Courtnay reports, "This being the first circle I visited I took special pains to ascertain the cost of cultivation. A man holding 7 acres can, if he pleases, work it without extraneous help, but larger holders have to hire labour, and such labour is paid for by the doon (6 acres). Each branch of cultivation is contracted for separately and the cost mainly depends on the supply of labour. The following has been the prevailing rates for the past four years:—
											Ploughing one doon Reaping one doon Threshing one doon
											... 97 ... 17 ... 16
											Total for labour, add cost of seed, 20 bas- kets at Rs. 40 per 100 8
											Total ... 67
											The amount of grain sown to a doon varied from 15 local baskets on good soil to 25 on poor, the average may be taken at 30; Rs. 67 per doon, or Rs. 10-68 per acre. The prices of grain for the past three years have been somewhat higher in this circle than others. Owing to its proximity to the market, but taking the average yield at 95 baskets per acre and average market-rate of Rs. 35 per cent, it will be seen that the gross profits accruing to the cultivators will be as follows: 35 baskets at 35 per cent, Rs. 38-5-0; cost of cultivation as above, Rs. 10-9-3, bearing a profit of say Rs. 28 to the cultivators. It is admitted that the labour charges are high, but I took these figures and a low rate of sale to show that even thus the cultivators can at these rates reap a handsome profit from the land. This, of course, is only the case where they work with their own cattle, but with men who hire them, it is different. The cost of working in such cases is said to be—ploughing, Rs. 17; dredging, one pair bullock, 200 baskets at 35 per 100, Rs. 77; reaping, Rs. 17; threshing, Rs. 15; seeds, Rs. 8-Rs. 117, or 17-84 per acre. This I believe to be a somewhat exaggerated statement; a man so situated could dispense with reap-

The amount of grain sown to a doon varied from 15 to 25 baskets on good soil to 25 on poor, the average may be taken at 20. Rs. 67 per doon, or Rs. 10.58 per acre. The prices of grain for the past three years have been somewhat higher in this circle than either Owing to its proximity to the market, but taking the average yield at 25 baskets per acre and average market-rate of Rs. 65 per cent., it will be seen that the gross profits accruing to the cultivators will be as follows :—25 baskets at 35 per cent., 15. 38- $\frac{1}{2}$, cost of cultivation as above Rs. 10.58, bearing a profit of say Rs. 23 to the cultivators. It is admitted that the labour charges are high, but I took these figures and a low rate of sale to show that even thus the cultivators can at these rates reap a handsome profit from the land. This, of course, is only the case where they work with their own cattle, but with men who hire it is different.

The cost of working in such cases is said to be,—ploughing, per doon, one pair bulls, 200 baskets at 35 per cent., Rs. 77; reaping, Rs. 17; threshing, Rs. 10; seeds, Rs. 8-R. 117, or 17 $\frac{1}{2}$ per acre, thus I believe to be a somewhat exaggerated statement; a man so situated could dispense with rep-

ing and threshing expenses. However, it is generally admitted that a cultivator who hires his cattle cannot make more than a comfortable support for himself. The circle is fully cultivated and I would recommend one rate throughout in the yield of the land is so uniform. For hire of buffaloes add the price of 80 baskets, giving with these animals a cost of communications good, and one hour from Akyab. Godowns are situated on the south of this part of the circle on the Mithgan chain. The soil is extremely fertile. It is nearly all under cultivation and the decrease in No. 4 was due to cattle disease and landowner dying. Bananuga will bear one rate throughout. Prices of labour and grain same as in other circles. This circle has been thrown into Sataba. Communications good and only one-fourth of a mile from Akyarh. The field throughout this circle may be considered heavy. The slight decrease was due to natural causes, such as men not being able to take up all the land. Cattle, diseases, etc., prices of labour, cultivation, and grain same as elsewhere. The crude of decrease is No. 3, 4, and 5 is said to be the salt water which cannot be bailed out without a deal of expense. No need of dividing Akyarh. The Yield in Nos. 4 and 5 is exceptionally good. Communications perfect, and distant about four hours from Akyo. Cost of cultivation—Mr. Courneuve reports, "To meet the accuracy of my former calculation of cost of cultivation I took another way in this circle, as follows:— Ploughing, four men at Rs. 25 each ... 100 Reaping, three men at Rs. 20 each ... 60 Threshing, two men at Rs. 15 each ... 30 Seeds, 60 Baskets at Rs. 40 ... 24

SEASON 1895-96.

Total ... Rs. 114

man working 20 acres (3 dooms) has to hire four men for ploughing at Rs. 25 each; reaping, three men at Rs. 20 each; threshing, two at Rs. 15—Rs. 914, or Rs. 1070 per acre. This is sufficiently near to show that my former estimate may be taken as true. The seed is sown broadcast and the circle fully cultivated.

The communication is perfect, and only four hours from the market. The cost of cultivation is the same here as in all other circles I have visited. It is fully cultivated and, looking at the uniform yield, I would suggest one rate throughout.

communications good and the circle within easy reach of the market. The decrease in the several kwns is on account of cattle-disease, but it has all been taken up again this year. The circle may be said to be fully cultivated, but in none of the lands is poor, because overworked. No. 10 was formerly a great, but the grasses surrendered it; the land is good and it should be taxed equal to the other kwns. The prices of labour and grain are as in other circles.

It is impossible to work No. 9, as they cannot bind the tides out. The decrease of 4 acres in No. 5 is accounted for by its being absorbed into No. 7. In No. 9 the wild animals, birds, and deer, destroy the crops. No. 13, the soil is so poor that only one ear per stalk of paddy is obtained, yet it is fully cultivated. The varied average of this circle is no doubt owing to its hilly nature. It is situated about one one-fourth tideless from Akyah and accessible throughout by boat. Cost of cultivation same as in other parts of township.

In this circle there is a marked decrease shown in kwns Nos. 3 and 4 was owing to the increase of price of labour and the rate ruled was from Rs. 18 to Rs. 25 only for 100 local baskets. All the waste has been taken up again. Crops in this circle are fair, and taking the local price and cost of cultivation into consideration the lands can well bear the proposed increase. Hire of a pair of buffaloes for a dozen, 100 baskets; oxen, 80 baskets; ploughing, Rs. 10 or Rs. 15; reaping, Rs. 30; threshing, Rs. 6.

In this circle appear to be equally good throughout and a uniform charge might almost be fixed for all the kwns. All the lands in this circle are under cultivation, and the people are in straits for grazing-ground for their cattle. Hire of buffaloes per pair for one dozen 150 or 180 baskets, Rs. 100 baskets; ploughing, Rs. 20; reaping, Rs. 30; and threshing, Rs. 8. This circle and Thatseypin are formerly one circle. The crops are as good as those of Thatseypin circle and the same rate could be fixed as are pro-

Kyawashin	1,034.15	91.98						

38. No records can be obtained to show the population in years previous to the last census, the thugis' returns in the district office having been eaten by white-ants. That population has increased and is increasing there can be no doubt. Bengalis from Chittagong, Burmans from Ramree, and settlers from the hills are to be found in considerable numbers throughout the tract. The following figures show the population of the whole district in past years and form a sufficiently correct index of the rate of increase of population in the settlement tract:—

1832	109,645
1842	130,084
1852	201,677
1862	227,231
1872	276,671
1882	359,706

They show that in 30 years the population has increased 73 per cent.

(c) Tenures. 39. The following table shows the areas under the different forms of tenure:—

1	2	3	4	5	6	7	8	9
DESCRIPTION OF TENURE ACCORDING TO ACT II WITH AREA HELD UNDER EACH.								
OWNERSHIP.								
Landholder, section 7, Act II, 1876.	Grantee, section 18, Act II, 1876.		In temporary occupation, section 19, Act II, 1876.					
Revenue paying.	Temporarily exempted from revenue.	Leesee.	Area.	Duration of occupation.	Other kinds of revenue such as taungya.	Total area.	Remarks.	
154,803.47 acres.	856.46 acres.	1,503.68 acres.	26,488.90 acres.	188,597.61 acres.		

40. From the statistics taken during the settlement operations of 1867 the rate of productiveness was found to be 60 to 136

(d) Former and present rates of productiveness per acre. baskets per acre, and the average fertility was assumed to be 90 baskets per acre (*vide* last chapter).

This however, as I have said, is not reliable as the areas cropped were too small to admit of accuracy. The Settlement Officer of 1867 notes that much of the land was exhausted from long use, and where this remark applied in 1867 it of course applies with double force now. The crop-cuttings conducted during the present settlement include in all an area of 198 acres and give an average outturn of 77 baskets.

41. No information is available for comparing the former and present rates of holding area. Probably the holding is much of

(e) Former and present holding areas. the same size now as it was 20 years ago. There are no signs yet of its diminishing as, judging from other districts, it undoubtedly will as population increases. The population is too scanty as yet to have affected the size of the holding.

(f) Former and present prices of produce.

42. The following table shows the prices of produce at Akyab during past years:—

Year.	January.	February.	March.	April.	Remarks.
	Rs.	Rs.	Rs.	Rs.	
1877	...	33	34	36	45
1878	...	44	49	55	60
1879	45	47	44
1880	...	30	33	34	33
1881	...	30	30	32	32
1882	...	27	28	21	19
1883	...	34	29	33	45
1884	...	29	27	26	24
1885	...	26	26	27	30
1886	...	35	36	32	32

43. There being nothing said as to the condition of the people in the meagre records of the settlement of 1867, it is difficult to make any comparison between their condition

(g) General condition of the people now as compared with periods of revision.

now and at that period. There is certainly no evidence whatever to show that their condition is one of decreasing comfort. But at the same time there is a marked absence of any indications, such as were found in the districts settled by me in the Irrawaddy valley, that the condition of the cultivator is becoming more comfortable, or that his standard of living is rising. His house is a wretched structure, no better than his forefathers occupied hundreds of years ago. His food is no better. There are few rest-houses or monasteries or pagodas to be seen in district villages to indicate the wealth of the inhabitants. Works of merit are few. Pwès and amusements are of a cheap and inartistic kind as compared with those in Burma. There are no industries. And both men and women are almost as wanting in the manners and polish of civilization as are the inhabitants of hill tribes.

CHAPTER V.

PROPOSED ASSESSMENT RATES.

44. The country has been divided into three assessment tracts on account chiefly of difference of quality of soil and partly of distance from the export market. The three tracts

(a) Assessment tracts. are shown in the accompanying map. Tract I consists of the lower part of the valley of the Kaladan, where the soil is generally good and the export market is within a tide's distance, and of a belt of land on both banks of the Mayu stretching as far north as Thègan, in which the soil is of excellent quality.

Tract II consists of lighter soils found in the neighbourhood of Uriattaung, where the Kaladan plain merges into hills. Thence it follows the range of hills northwards, and from Rathedaung to Thègan skirts the Mayu. In this tract there is much high-lying and exhausted land, and the soil is generally not so good as in Tract I.

Tract III consists of the slopes of the Mayu hills, a kôndan stretching from Rathedaung southwards, and a kôndan near Thègan. The land is high and sloping, and cannot retain water. The soil is much exhausted and inferior to that in both Tract I and Tract II. In fact it is as poor a soil as I have ever seen paddy grown on in Burma.

In Tract III I have also included the kwins in the extreme north of the Mayu valley not on account of poorness of soil, for the land is new and tolerably fertile, but because they are at a great distance from the export market, and though in the height of the season there is no great difference in price, in the beginning of the season boats do not come up so far, and it is hard to obtain a market at reasonable prices. In this part also the crops often suffer from the ravages of

pigs, which abound in the surrounding jungle. The list of circles included in each tract will be found in paragraph 70.

45. It will be noticed that in my arrangement Treatment of land liable to of tracts I have taken no account of land liable to flooding:

flooding by salt water. The reasons are—

- (i) the bunds are small and do not cost very much;
- (ii) land protected by bunds is generally very fertile;
- (iii) in soil classification some allowance has been made for such land.

46. The average area of holding in all three tracts is 13 acres. By 'holding' is here meant the land owned by one person whether within a single boundary or not. Unfortunately it is,

as a rule, not within a single boundary and consists of scattered pieces, which has given much trouble both in collecting statistics and in preparing the registers.

47. In each tract the soil has been divided into two classes. First class includes not only the best soils, but all soils of average quality; second class includes those under the

(c) Classes of soil. average. First class is the standard soil of the tract, and second class the inferior soils.

The soils are loams, more or less sandy, and there are few clays.

For garden and miscellaneous cultivation no division into tracts or classification of soils was found necessary.

(d) Productiveness per acre for 48. The crop-cutting statistics (Appendix I) show the average outturn of first class soil to be 82 baskets each soil and tract.

and of second 66.

Tract by tract the rates are as follows:—

	Tract I ... 1st class	... 85·56	... 2nd class	... 73·87
	Tract II ... do.	... 81·94	... do.	... 62·44
	Tract III ... do.	... 79·98	... do.	... 58·64

Modifying these in accordance with the impressions received during a careful kwin-to-kwin inspection I assume the following rates of productiveness as a basis for settlement:—

	Tract I ... 1st class	... 85	... 2nd class	... 70
	Tract II ... do.	... 80	... do.	... 70
	Tract III ... do.	... 75	... do.	... 50

It may be useful to compare these figures with the outturns admitted by the cultivators themselves. They state that best soils give an outturn of 700 to 800 baskets per kyat or doon, ordinary soils give 500 to 600 baskets, and worst soils 300 to 400 baskets. The kyat or dun is nominally $6\frac{1}{2}$ acres, but if properly measured it would be 8 acres. The admitted outturns would therefore be 85 to 100 baskets for best lands, 60 to 75 baskets for ordinary lands, and 40 to 50 baskets for inferior lands.

It is impossible to fix any rate of productiveness for garden and miscellaneous cultivation.

49. It will be seen from the table of prices quoted in last chapter that the

(e) Local value of produce. average price of paddy at Akyab for the past five years has been Rs. 29. The price in the north of the Mayu valley is about Rs. 4 lower than in Akyab. For the purposes of calculating rates the following prices may be assumed:—

	Rs.
Tract I 29
Tract II 27
Tract III 25

(f) Cost of living of agricultural family. 50. The cost of living of the ordinary cultivator is as follows:—

	Rs.
Paddy for home consumption, 300 baskets	... 80
Food and other expenses including clothes	... 45
Capitation-tax	... 5
Total	130

The cost of living as shown in Appendix II varies from Rs. 80 to Rs. 280, but on the average holding I think Rs. 130 represents it fairly. The cost of living per acre of the average holding would therefore be Rs. 10.

(g) Cost of cultivation.

51. From the statistics shown in Appendix II it will be seen that the cost of cultivation in an average holding is about Rs. 6 per acre. At last assessment (*vide* Chapter III) Mr. Courneuve calculated the cost of cultivation per dun as follows:—

	Rs.
Seed, 20 baskets at Rs. 40	... 8
Ploughing	... 27
Reaping	... 17
Threshing	... 15
Tota	67

This, if the dun were properly measured, would amount to Rs. 8·4 per acre.

The cost of cultivation is ordinarily calculated by the dun, and the rates stated for ploughing, reaping, &c., are those now in use; but the calculation is based on the supposition that the cultivator has hired everything and done none of the labour himself.

(h) Statement of rates on the soil classes in each tract based on the right of the State to one-half of the net profits, and method of working them out.

Rate = half net profits

= $\frac{1}{4}$ (outturn - cost of living - cost of cultivation)

gives the following rates for the three tracts:—

1st class soil.	2nd class soil.
Tract I ... 4·32	... 2·15
Tract II ... 2·80	... 1·45
Tract III ... 1·37	... Minus.

53. Modification of these rates.—But as every step is liable to error and every

(i) Rates finally proposed. factor is a matter of hypothesis, these calculations cannot be taken as the real basis of settlement proposals, and can only be useful as a check on deductions obtained from other sources. The increase or decrease of revenue rates must in reality be based on considerations of a general nature, such as the probable pressure of the proposed demand as compared with present and past demands, the condition of the people, the opinions of men of local knowledge, the facility of collection, the incidence of the revenue as compared with other settled districts. These considerations I now proceed to discuss.

54. The cultivator produces paddy and pays revenue in money. The price

of paddy is therefore the measure of his ability to pay. In the settlement of 1867 the price of paddy is calculated at Rs. 35, i.e., Rs. 17·8-0 per hundred Akyah baskets. From other evidence I believe the price at this time was about Rs. 20.

In the settlement of 1879 the price of paddy was much higher, the quotations on which the settlement was based being given at Rs. 35 to Rs. 45.

The average price of the last five years has been Rs. 27, i.e., average jungle price, and it certainly would not be safe to assume a higher average price than this for the new period of settlement.

Assuming then that the cost of cultivation and cost of living are the same as in 1867 and 1879, and that the only factor that affects the cultivator now as compared with then is the price of paddy, it follows that the same revenue demand must press lighter on the cultivator now than it did in 1867, but much more heavily than it did in 1879. The tax was increased from 4 to 8 annas in 1879 and the enhanced demand was easier paid when it was imposed than it is now, or than it is likely to be during the next 15 years.

55. Thugis are more interested than any other official in the increase of

Local opinion. revenue, and they have a more intimate local knowledge of its effect. The result of general enquiries made from thugis during my tours is that no thugyi recommended an increase of rates, and some, especially those in Tract III, recommended a decrease and admitted that the people had the greatest difficulty in paying the present demand.

My experience of thugyis in former settlements has been that, though they rarely make unreasonable proposals, they are always willing to recommend an increase wherever it is practicable.

56. The table of coercive processes (Chapter III) shows that the land revenue is not collected in Akyab with the same facility as in Facility of collection. the districts that have come under settlement in the Irrawaddy delta, and the comparatively large percentage of revenue (4·2) that has to be collected by the issue of compulsory processes is an argument against increasing the demand.

57. There is no visible improvement in the Condition of the people. condition of the people, and more than half of them are in debt.

58. In comparing generally the Akyab district with other districts settled Comparison with other settled by me (Tharrawaddy and Prome) and taking into districts. consideration the relative fertility and prices of produce, I have no hesitation in saying that the present land revenue demand from the Akyab district is higher than either the present rates, or the maximum sanctioned rates, or the highest rates proposed by the Settlement Officer in either of these districts.

59. Such being the facts it is obvious that I cannot recommend any general Reasons for not recommending a increase of taxation. Had imperial finances been decrease. in a flourishing state, I think I should have recommended a decrease; but I am aware that in the present financial state of affairs, a decrease of taxation cannot be admitted except on the very strongest grounds, and I think that the following reflections will show that relief can be given where required, without diminishing the total demand, and that there is no urgent necessity at present for a general decrease.

60. The chief cause of the heavy pressure of the present tax is the inequity Inequity of incidence of present of its incidence, and this can be remedied by the tax. present settlement.

61. The difference between good and bad soil is very sharply marked in This inequity remedied by soil this district, and a tax which includes all land of the classification; same kwin in one rate presses hard on the poorer land. This has been remedied by soil classification.

62. The kwin rates are also in many cases inequitable, and the revenue rate is often no index of the quality of the kwin. and by tract classification; This has been remedied by the division into tracts.

63. The worst cause of the unfair pressure is the treatment of fallow land. and by proper treatment of fal. It has not been the custom in this district (for what low land. reason I cannot find) to impose the fallow rate of two annas; the cultivator has had to pay the full tax whether the land was cropped or not. This will be remedied by the new settlement and the new revenue rules, by which all land left uncultivated from whatever reason is chargeable with the fallow rate. This rate will be the safety-valve of the new settlement, and there will be no fear of an inequitable incidence if Revenue Officers will but attend to it.

64. On these grounds I think that the present pressure of taxation can be much relieved by changing its distribution. And as final proposal. there are no signs of decreasing prosperity, nor any signs of inability to live up to the ordinary standard, low as it is, and as there is no actual pinching or distress, I think that the relief thus provided will be sufficient. I propose, therefore, to retain the total revenue pretty much as it stands, and to alter the distribution so as to make it press fairly on all. This I propose doing by making a marked difference between the rates on first and second class soils, and by putting much lower rates on the poor and exhausted soil of Tract III.

Rates proposed.

65. The rates I propose are—

	1st class.			2nd class.		
	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.	Rs. A. P.
Tract I	... 2 8 0	... 2 8 0	... 2 8 0	... 1 8 0	... 1 8 0	... 1 8 0
Tract II	... 2 0 0	... 2 0 0	... 2 0 0	... 1 4 0	... 1 4 0	... 1 4 0
Tract III	... 1 8 0	... 1 8 0	... 1 8 0	... 1 0 0	... 1 0 0	... 1 0 0

The result will be an increase of 4 per cent. in Tract I, an increase of 8 per cent. in Tract II, and a decrease of 30 per cent. in Tract III.

66. The present rates for garden and miscellaneous cultivation are the

Rates proposed for garden and highest rates for paddy-land in each circle. For Facility of collection. garden and dani cultivation I propose a rate of Rs. 2 and for miscellaneous cultivation Re. 1. The garden and dani require no explanation. The low rate for miscellaneous is proposed in order to foster the growth of other kinds of cultivation besides paddy and follows the plan adopted in other settled districts.

67. For solitary fruit trees I propose a tax of four annas per tree, but as a matter of fact there are few or no solitary fruit trees except on village-sites, where they are free from taxation.

68. The following table shows a comparison of tenants' rates per acre with those shown under clause (h) and with those finally proposed :—

Tenant rates per acre.	Rates under clause (h).		Rates now proposed.	
	Rs.	Rs.	Rs.	Rs.
4·80	4·82·80	2·15·1·45	2·8	2, 1·8, 1·4
	2·15·1·45	1·87		1

(k) Comparison of current with proposed rates.

69. The following table gives a comparison of current kwin rates with proposed rates :—

Circle.	Current rates.		Proposed rates.		Remarks.

(ii) Resulting total assessment. 70. The resulting total assessment at proposed rates is—

	Revenue.	Cess.	Total.	
				Rs.
Paddy	3,21,244·46	32,124·44	3,53,368·90	
Garden	7,206·60	720·66	7,927·26	
Miscellaneous	2,602·82	260·28	2,863·10	
Total	3,31,053·88	33,105·83	3,64,159·26	

(m) Difference between proposed and expiring assessment.

71. The expiring assessment is—

		Revenue.	Cess.	Total.
		Rs.	Rs.	Rs.
Paddy	3,18,331·65	31,833·16	3,50,164·81
Garden and miscellaneous	15,008·12	1,500·81	16,508·93
	Total ...	3,33,339·77	33,333·97	3,66,673·74

and the difference is—

		Revenue.	Cess.	Total.	Percentage.
		Rs.	Rs.	Rs.	
Paddy	+ 2,912·81	+ 291·28	+ 3,204·09	·67 per.
Garden and miscellaneous	- 5,198·70	- 519·87	- 5,718·57	cent.
Total	...	- 2,285·89	- 228·59	- 2,514·48	

Explanation of this difference. The decrease of 2,514·48 is not real, but apparent. It is owing to much of the yearly shifting miscellaneous cultivation, as also some garden and dani not having been shown on the survey map. These errors can easily be corrected by the Supplementary Survey and they do not affect the value of the settlement, and therefore, in accordance with the instructions contained in Revenue Secretariat letter No. 2557-41S., dated the 4th December 1884, the maps were not returned to the Survey office for correction.

In paddy revenue there is an increase of Rs. 3,204·09, and this increase may be taken to represent the actual result of the proposed rates.

(n) Incidence of proposed and expiring assessment.

73. The incidence of the proposed and expiring assessment per acre is 1:98.

74. The increase in area owing to the correct measurement of the survey is 22* per cent., and the re-adjustment of the current rates has caused a compensating decrease of the same percentage.

* This is calculated in paddy area alone, *vide* paragraph 73.
